

Product Thumbnail Hover-Swap in Bricks Builder

Showing the second product image on hover, on WooCommerce shop and category pages

Short answer: this is not a native Bricks toggle, but you do not need a plugin either. The cleanest method is to build it inside your Bricks products loop using two stacked images and one small CSS rule. Option A is recommended. Option B is a plugin route if you would rather not touch CSS at all.

Assumption: this is WooCommerce, and "the second image" means the first image in each product's Product Gallery (the images sitting next to the Featured image on the product edit screen).

Prerequisite - do this first

This is the number one reason a hover swap appears not to work: every product needs at least two images.

1. Go to Products and edit a product.
2. In the right sidebar, set Product image - this is the main thumbnail.
3. Just below it, in Product gallery, add at least one image. The first gallery image is what will show on hover.
4. Click Update. Repeat for your other products.

Products with no gallery image simply will not swap - nothing breaks.

Option A - Bricks only, no plugin (recommended)

1. Create the loop card

1. Bricks > Templates > Add New. Set Template type to Archive and name it something like "Shop / Category Archive".
2. Open Template Settings > Conditions and add the condition Archive Type > Product archives. This covers both the shop page and all product category pages.
3. Click Edit with Bricks.
4. Add a Container. This is your product card.
5. With the container selected, switch on the Query loop toggle (the loop icon next to the element name). Set Query > Type to WooCommerce Products (some Bricks versions label this as Post type > Products). Leave everything else at default so the loop inherits whichever category is being viewed.

2. Add the two images

6. Inside the loop container, add a plain Div and name it "Image wrap".
7. Inside that Div, add an Image element. For its source, click the dynamic data (lightning) icon and choose {featured_image}.
8. Add a second Image element directly beneath it, inside the same Div. For its source use the dynamic data tag:

```
{woo_product_gallery_images:1}
```

In the dynamic data dropdown, look for "Product gallery images". The :1 means "just the first gallery image". If your Bricks version does not accept :1, simply pick the gallery tag as-is - the CSS below still works.

9. Add the rest of the card as normal: Product Title ({post_title}), Price ({woo_product_price}), and link the container to {post_url}.

3. Add the hover CSS (one paste, one time)

10. Select the "Image wrap" Div, go to Style > CSS > Custom CSS, and paste the following:

```
%root% {
  position: relative;
  overflow: hidden;
}
%root% img {
  display: block;
  width: 100%;
  height: 100%;
  object-fit: cover;
  aspect-ratio: 3 / 4; /* use 1 / 1 for square thumbnails */
}
%root% img:last-child {
  position: absolute;
  inset: 0;
  opacity: 0;
  transition: opacity .35s ease;
}
%root%:hover img:last-child {
  opacity: 1;
}
```

%root% is Bricks' shortcut for "this element", so the rule can never leak into other parts of the site. Save the template, then view a product category page and hover.

4. Mobile behaviour

Touch devices have no hover state, so they simply show the main image - which is what you want. Nothing further to configure.

Option B - Plugin route (zero CSS)

Use this only if you are keeping WooCommerce's default product grid rather than a Bricks query loop.

1. Go to Plugins > Add New and search for "WooCommerce Product Image Flipper" - free, very lightweight, and does exactly this one job.
2. Install, then Activate.
3. Make sure each product has a gallery image (see Prerequisite above).
4. Done - there is no settings screen to configure.

Caveat: it hooks into WooCommerce's own loop markup. If you later rebuild the archive with a Bricks query loop, the plugin stops applying and you would move to Option A anyway. That is why Option A is the more future-proof choice.

Which one to pick

- Building the category page in Bricks (very likely, since you are using Bricks): choose Option A. No extra plugin, nothing to maintain, full control over sizing and animation, and it survives theme and plugin changes.
- Using stock WooCommerce templates and want it done in two minutes: choose Option B.

Optional tweaks for Option A

- Slide instead of fade: in the :last-child rule replace opacity with transform: translateX(100%), and on hover use transform: translateX(0).
- Subtle zoom on hover: add %root%:hover img { transform: scale(1.04); } and put transition:

transform .4s ease; on %root% img.

- Consistent grid: keep the aspect-ratio value identical across all cards so rows never jump.

Troubleshooting: if the second image never appears, check (a) the product actually has a gallery image, (b) the second Image element is the last child inside the Image wrap Div, and (c) you pasted the CSS on the Div and not on one of the Image elements.
